

Soft Phones

An advantage of using a SIP-based telephone system is that besides supporting SIP-based desk telephones, it can also support a variety of 'soft phones'.

What is a Soft Phone?

Soft Phones are applications that can be added to a smart, mobile phone, tablet or a laptop computer. They take advantage of the processing power and built-in media handling of today's computers – and lets face it, your mobile phones are pretty sophisticated computers too!

Simply add the Soft Phone application, a USB headset, or mobile phone ear-buds with microphone, and you have turned your computer into a telephone.

This is handy for when you are on the road, in a home office, or in any other place away from the office with decent Internet access.

Soft Phone Support

Unity Connected Solutions does not make the Soft Phone application, but we recommend the Bria Soft Phone applications can provide some information on the their versions and references on how to set up.
